This invention is related generally to keyless entry systems for vehicles, and in particular to a method for configuring and programming a vehicle keyless entry system. A keyless entry system is a device that is used to unlock and lock the doors of a vehicle. Typically, the keyless entry system includes a reader mounted to the inside of the vehicle door and a transmitter mounted to the vehicle. When the door is closed, the transmitter transmits a signal that activates the reader. The reader then uses a signal, such as an electrical signal, to unlock the door. A transmitter may also be used to lock the door. Typically, the transmitter includes a lock mechanism that communicates with the reader and causes the reader to lock the door. A user of the keyless entry system enters a code into the transmitter or a key fob. The code may be a numeric code or an alphanumeric code. When the code matches one of a predetermined set of codes stored in the transmitter, the reader unlocks
